MagicCode Super-Resolution Software Data Reporting Notice

Document Version: v1.2.0

1. Purpose

This notice provides a concise explanation of technical data reporting in MagicCode Super-Resolution Software v1.2.0. It is a customer-facing summary and should be read together with the Privacy Policy.

2. What May Be Reported

For compatibility optimization, troubleshooting, license compliance, stability analysis, and performance improvement, the software may report limited technical data, including:

- Device model and platform information.
- UUID used to distinguish device or software instances.
- Client IP address for network diagnostics.
- Algorithm mode (alg_mode), scaling factor (scaler_factor), input width and height, and thread count (num_threads).
- Error code (error_code) and report reason (report_reason).
- Processing statistics: process_call_count, process_success_count, process_fail_count.
- Processing time statistics: latest, minimum, maximum, total, and average processing time.
- Transmission integrity data, such as packet checksum.

3. What Is Not Reported

- The software does not upload image content.

- The software does not upload video content.
- The software does not require personal identity information such as name, address, or contact details for technical reporting.

4. When Reporting May Occur

- Software initialization.
- Software uninitialization.
- Control parameter changes.
- Operational errors.
- Periodic processing statistics after a defined number of processing calls.

5. Network Requirement

Technical reporting requires network connectivity to MagicCode's reporting service. If the network is blocked, reporting may fail. Such reporting failure should be handled separately from super-resolution processing unless the customer has a license or deployment arrangement that requires connectivity.

6. Customer Integration Notice

If you integrate MagicCode into your own application or distribute it to end users, you are responsible for presenting any required privacy notice, consent, opt-out option, or data processing disclosure required by applicable law and by your agreement with MagicCode.

7. Relationship to Privacy Policy

The Privacy Policy is the controlling document for data collection, use, storage, disclosure, retention, and user rights. This notice is a summary for implementation and release review.

Reporting Schema Update (v1.2.0)

- Device and runtime identifiers: uuid, client_ip, device_model, sdk_version, backend.

- Runtime parameters: alg_mode, scaler_factor, width, height, num_threads.

- Diagnostics: error_code, report_reason.

- Processing statistics: process_call_count, process_success_count, process_fail_count, process_last_time_us, process_total_time_us, process_avg_time_us.

- The fields process_min_time_us and process_max_time_us are not reported in the current schema.
